

# Model Order Reduction for Uncertainty Quantification

## Task

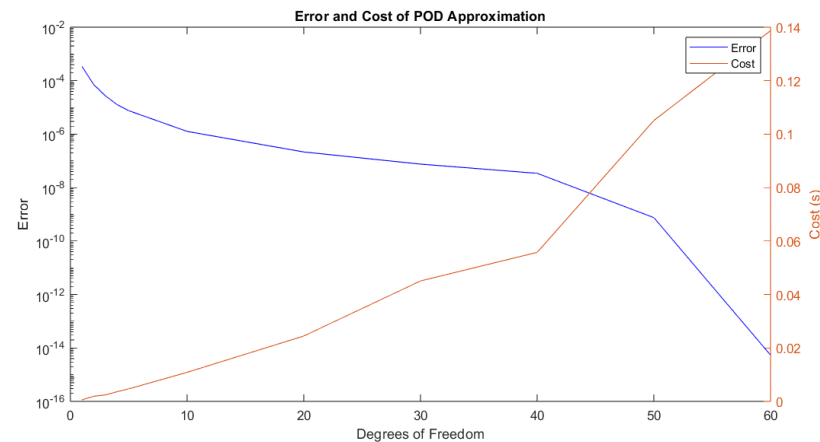

Implement a model order reduction approach with a finite element library for Monte Carlo-based uncertainty quantification.

- Get familiar with sfepy library to perform stationary (time-invariant) finite element analysis
- Implement basic Monte Carlo method using sfepy to quantify the uncertainty of the response of the structure
- Construct reduced-order model in sfepy using proper orthogonal decomposition (POD) based on snapshots of the response
- Compare response of the reduced order model with the full model in context of structural reliability

### Project Characteristics

Monte Carlo samples.

Error and cost of reduced model.
